

# Using CORBA with latest Eclipse and Java version

Here is how to configure eclipse to be able to use CORBA without the plugin. This was done on latest eclipse version and JDK 1.8.

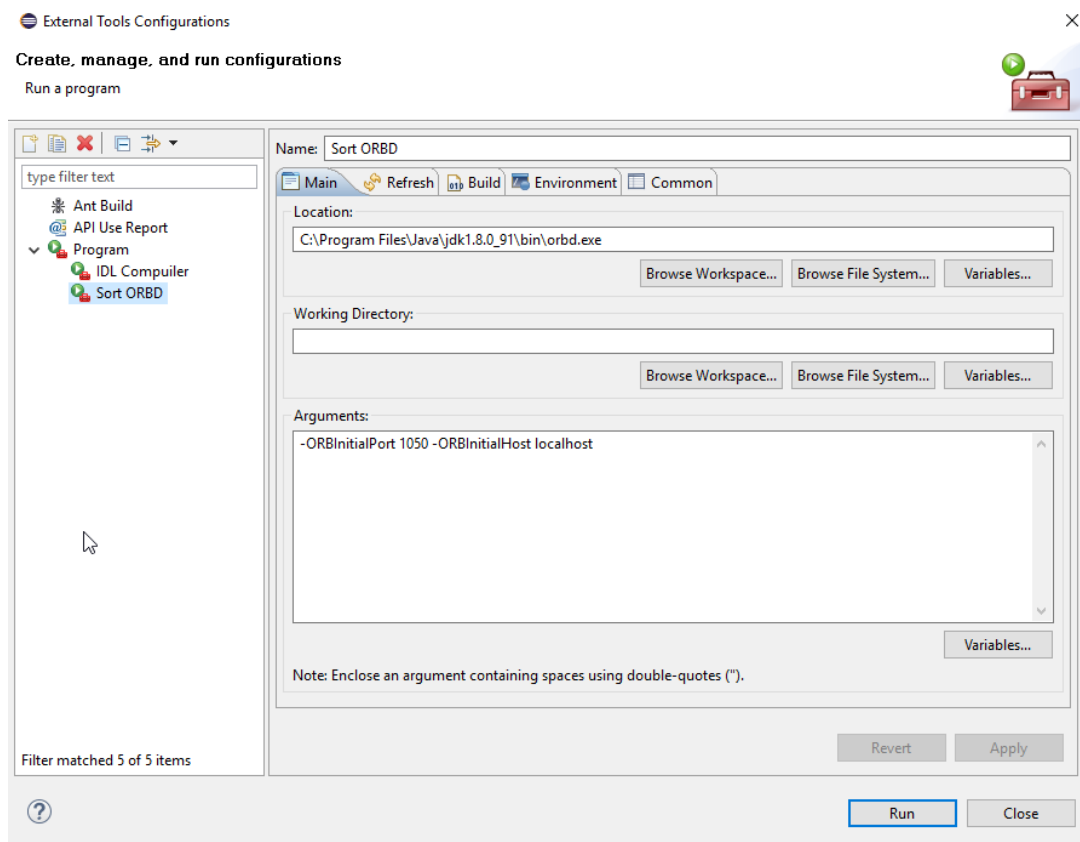

## External tools configuration

### 1) Configure IDL compiler External tool

The location depend on where your JDK is installed.

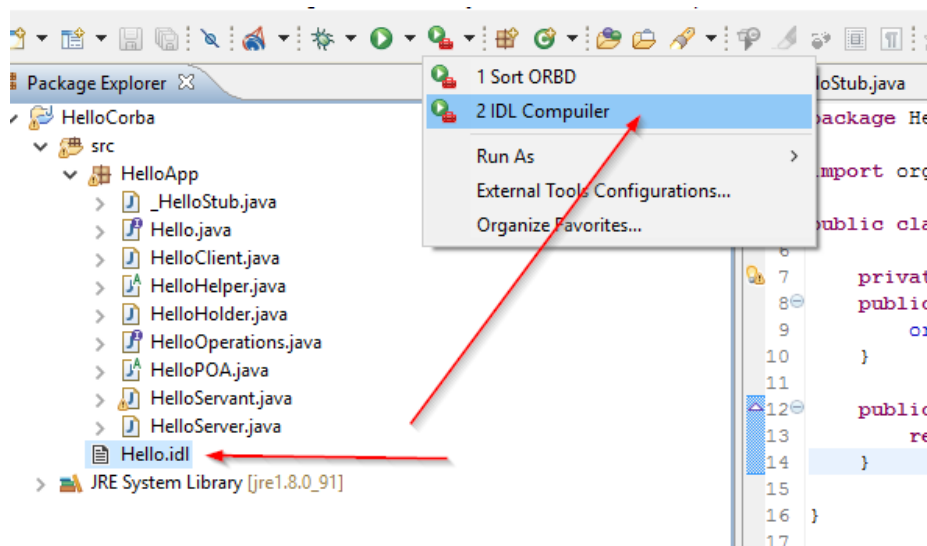

## 2) Create a 2<sup>nd</sup> external tool that will start ORBD

Again, the location of the orbd.exe is in your JDK folder.

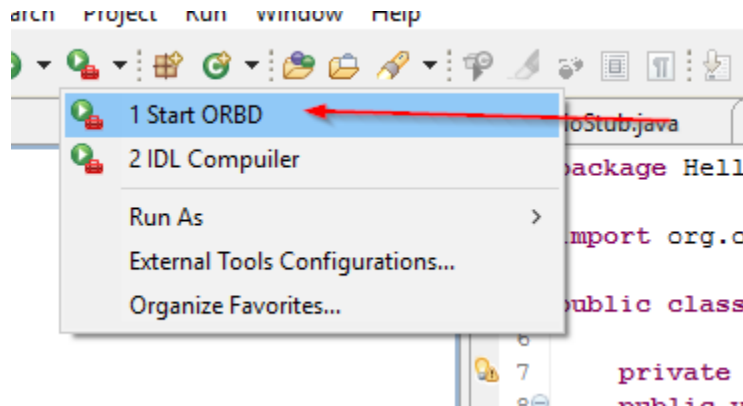

## To compile an IDL

While you have the IDL selected in eclipse, use the Compile IDL tool.

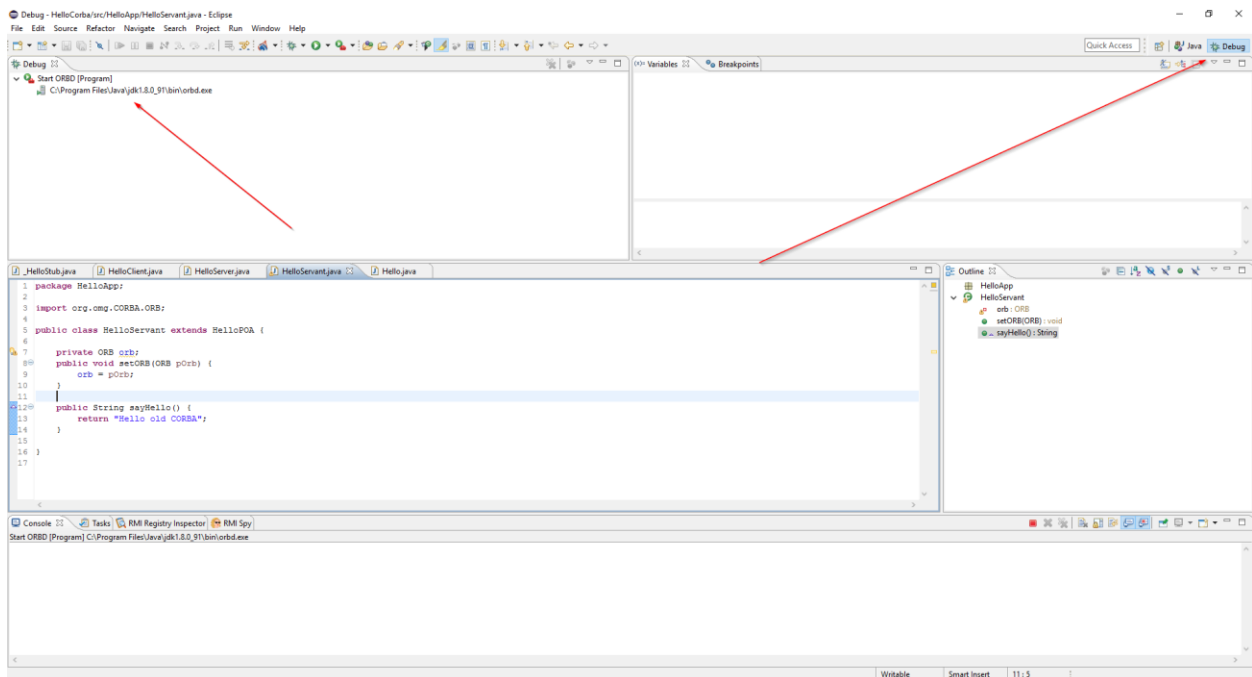

## How to start and use CORBA

Before starting any application that need CORBA, you will have to start the ORBD.

To confirm execution, go to debug perspective and check that it is a running process.

From now you should be able to use any CORBA application.

Be sure that you use the same hostname and port on application code and ORBD.
